

Nuclear physics: the ISOLDE facility

Lecture 2: Science of ISOLDE

Meet ISOLDE trailer:
<https://videos.cern.ch/record/2285037>

Magdalena Kowalska
CERN, PH-Dept.
kowalska@cern.ch

on behalf of the CERN ISOLDE team
www.cern.ch/isolde

Outline

Aimed at both physics and non-physics students

Lecture 1: Nuclear and ISOLDE facility

This lecture: Science of ISOLDE

- ➊ Measured properties and used techniques
- ➋ Recent studies in:
 - nuclear physics
 - nuclear astrophysics
 - fundamental studies
 - material science
 - biology
 - medicine

Baking-powder quiz

- Prize winners:

- Amal
- Lea-Maria
- Peter
- Lucas, Elisa, Elli, Andres
- Alice

ISOLDE techniques and physics topics

Nuclear physics
and
atomic physics

Material science
and
life sciences

Chart of nuclei

- Magic numbers:
 - Proton and neutron shell closures
 - Nuclear shell model – in analogy to atomic shell model

- Nuclear driplines

- Beyond: nuclei are unbound

- Line of nucleosynthesis

- On p-, n-rich sides

ISOLDE experimental setups

ISOLDE experiments

Laser spectroscopy and nuclear properties

Lasers allow studying ground-state (and isomeric) properties of nuclei, based on:

Atomic hyperfine structure (HFS)

(interaction of nuclear and atomic spins)

- HFS details depend on:

- Spin -> orbit of last proton&neutron
- Magnetic dipole moment -> orbits occupied by protons&neutrons
- Electric quadrupole moment -> deformations

Yordanov et al,
Phys. Rev. Lett.,
110, 172503 (2013)

Isotope shifts (IS) in atomic transitions

(change in mass and size of different isotopes of the same chemical element)

- IS between 2 isotopes depends on:

- difference in their masses & charge radii

Shape staggering of mercury isotopes with RILIS

Penning-trap mass spectrometry

- Penning trap

- superposition of static magnetic and electric field
- Ion manipulation with radiofrequencies

Free cyclotron frequency is inversely proportional to the mass of the ions!

$$\omega_c = qB / m$$

Masses around ^{100}Sn with ISOLTRAP

Nature Physics 17, 1099 (2021)

Decay spectroscopy

- Different detectors to sensitive to emitted:
 - Alpha particles
 - Beta particles
 - Gamma rays
 - Protons or neutrons
- Isolde Decay Station
- soon: polarised beams at VITO

Coulomb excitation

Excitation of a projectile nucleus (radioactive) by the electromagnetic field of the target (made of stable nuclei)

Observables: Transition energies and intensities
=> Determine new excited levels and study deformations

Nuclear astrophysics at HIE-ISOLDE

neutron excitations in ^{207}Hg by neutron-adding (d, p) reaction in inverse kinematics

Isolde
Solenoidal
Spectrometer

Beta-NMR in organic samples

Unstable probe nuclei with spin > 0 in magnetic field

Spin hyperpolarisation

+ beta decay anisotropy

Beta decay, $I > 0$

Thermal equilibrium

$$P \approx 10^{-5} = \frac{1}{100,000} \quad \text{at } 3T$$

Hyperpolarized

$$P \approx 50\% = \frac{50,000}{100,000}$$

Up to 10 orders of magnitude more sensitive than conventional NMR,

100 x more precise than solid state NMR

Applications in biology (metal ion interactions)
And nuclear physics: distribution of magnetisation

Scalar currents with ^{32}Ar

- Aim: search for scalar current contribution in predominantly vector current of β -decay via $\beta-\nu$ correlation

WISARD experiment

- Tool: β -delayed p decay of ^{32}Ar , Doppler effect on proton energy
- Present limits on scalar current from $\beta\nu$ correlation $a_F = 0.65\%$

Radioactive molecules & Beyond SM

Low-energy SM tests

- Nuclear matter
- Nuclear structure
- BSM searches

New e-N interactions?

- Dark Matter properties?
- New forces?

P-violation

T-violation

- Baryogenesis

Nature 581, 396 (2020)

From M. Udrescu

Heavy-ion toxicity

- Studied with Perturbed Angular Correlation method

Material science

- Emission channeling
 - Position of implanted ions

^{229}mTh : towards a nuclear clock with VUV and EC

- Determination of isomer energy with vacuum UV spectroscopy:

- ^{229}Ac decay to ^{229}mTh
- Internal conversion decay branch removed via study in a crystal
- CaF as host (wide band gap material)
- Implantation site verified with emission channeling

S Kraemer et al, *Nature* 617, 706 (2023)

Video: <https://videos.cern.ch/record/2297990>

New medical isotopes

Collection at ISOLDE

Radiochemical
purification and
labeling

Injection into mouse

PET/SPECT imaging and
tumor treatment

- Theranostics = therapy and diagnostics together
 - Production of isotopes at ISOLDE
 - Chemical selection and mice treatment in PSI
- Soon at ISOLDE-Medicis

Upcoming projects

- MIRACLS: laser spectroscopy in electrostatic trap (MR-TOF)
- PUMA: trapped antiprotons from AD to measure neutron skins
- BELAPEX: spin and parities of neutron emitting states with polarised nuclei
- Distribution of magnetisation and neutron halos

Quiz 2

- What is Hulk's connection to the topic of these lectures?

Replies can be sent to Kowalska@cern.ch

Summary

- Research topics with radionuclides:
 - Nuclear and atomic physics
 - Astrophysics
 - Fundamental studies
 - Applications
- Studied properties:
 - mass, radius, spin, moments, half-life, decay pattern, transition probabilities
- Examples of ISOLDE experimental techniques
 - Laser spectroscopy
 - Ion traps
 - Decay spectroscopy
 - Coulomb excitation
 - Nucleon-transfer reactions
- Applications
 - Material science
 - Life sciences: bio- and medical

Collinear laser spectroscopy

COLLAPS, CRIS, RILIS

Charge radii around lead

Radii described well with mean field models

Studies with ion traps

- Penning trap = cross of magnetic and electric field
- Ion manipulation with radiofrequencies
- Possibility of purifying the ion ensembles

Penning-trap mass spectrometry

- Penning trap

- superposition of static magnetic and electric field
- Ion manipulation with radiofrequencies

Free cyclotron frequency is inversely proportional to the mass of the ions!

$$\omega_c = qB / m$$

Penning-trap mass spectrometry

ISOLTRAP setup

From cyclotron frequency to mass

$$\nu_c = \frac{1}{2\pi} \frac{q}{m} B$$

Relative mass uncertainty around 10^{-8}

10 ms, 1-10%

determination of cyclotron frequency ($R = 10^7$)

removal of contaminant ions ($R = 10^5$)

Bunching of the continuous beam

Beta- and gamma decay studies

50 ms - 10 s, 100% precision Penning trap

50 ms - 1 s, 100% preparation Penning trap

TOF detector

precision Penning trap

TOF detector

preparation Penning trap

laser ablation ion source

ND:YAG 532nm

MR-TOF detector or BN beam gate

MR-TOF MS

trapping cavity

1st deceleration cavity

10-100 ms, >50%

ISOLTRAP

- Experiment
- Experiments in literature
- VS-IMSRG 1.8/2.0(EM)
- VS-IMSRG N²LO_{GO}
- DFT HFB without time-odd fields
- DFT HF without time-odd fields
- DFT HFB with time-odd fields
- DFT HF with time-odd fields

Masses and nuclear structure

- Mass filters (mass differences) to “filter out” specific effects, e.g.
 - Differences in binding energies (one- or two-neutron/proton separation energies)

Two-neutron separation energy

$$S_{2n} = B(N - 2, Z) - B(N, Z),$$

Closed shells visible as a sudden drop after the magic number (N=20 and 28)

Calcium-54 and nuclear forces

- Shell closures: backbone of nuclear structure
 - They change far from stability – how and why?
- Masses of neutron-rich calcium isotopes
 - Three-body nucleon forces required to reproduce data
 - New neutron shell closure at N=32
- Outlook: mass of $^{55,56}\text{Ca}$
 - HIE-ISOLDE intensities

Mass of zinc-82

After several attempts at ISOLTRAP
and elsewhere

Neutron-star composition:
- Test of models
- ^{82}Zn is not in the crust

- Combined ISOLDE technical know-how:
 - neutron-converter and quartz transfer line (contaminant suppression)
 - laser ionisation (beam enhancement)

R.N. Wolf et al, Phys. Rev. Lett. 110, 041101 (2013)

Decay spectroscopy

- Different detectors to sensitive to emitted:
 - Alpha particles
 - Beta particles
 - Gamma rays
 - Protons or neutrons
- For example WINDMILL setup:
 - Alpha and gamma detectors
 - Used for studies of beta-delayed fission (i.e. fission following a beta decay)

Beta-delayed fission of mercury-180

WINDMILL setup

^{180}TI (Z=81, N=99)

PRL 105, 252502 (2010)

PHYSICAL REVIEW LETTERS

New Type of Asymmetric Fission in Proton-Rich Nuclei

- ➊ Nuclear shell effects are important in fission, but:
 - Unexpectedly ^{180}Hg does not fission in two semi-magic ^{90}Zr ($Z=40, N=50$)
 - Fission theories do not predict the results correctly

Coulomb excitation

Excitation of a projectile nucleus (radioactive) by the electromagnetic field of the target (made of stable nuclei)

Observables: Transition energies and intensities
=> Determine new excited levels and study deformations

Nucleon-transfer reactions

Miniball + T-REX setup (Si detector barrel):
gamma detectors and particle identification

Typical reactions: one or two-nucleon transfer (d,p), (t,p)

Information:

Observables

- energies of protons (+ E_g)
- angular distributions of protons (+ γ -rays)
- (relative) spectroscopic factors

(single-particle) level energies
spin/parity assignments
particle configurations

study single-particle properties of nuclei

=> Similar configurations = large overlap of wave functions =

Large probability of transfer reaction

Octupole deformation and MINIBALL

- Octupole shape – very rare nuclear shape
 - Test ground for nuclear models
 - Important in searches for permanent electric-dipole moments (EDM) – beyond Standard Model

- Method: Coulomb excitation
 - Beam accelerated to 2.8 MeV/u
 - Excitation of a projectile nucleus by e-m field of the target nuclei

- Detection with MINIBALL gamma-array
 - Germanium detectors - high efficiency gamma detection
 - Silicon detectors for particle identification

Pear-shape: beyond Standard Model

- Results: Enhanced electric-octupole transitions
 - direct measure of octupole correlations
- Pear shape shown experimentally in radium-224
- Best candidates for EDM searches identified: radium-223, 225
- Enhanced atomic EDM moment
 - Schiff moment enhanced by ~ 3 orders of magnitude in pear-shaped nuclei
 - In radium atoms, additional enhancement due to near-degeneracy of atomic states
- Outlook - HIE-ISOLDE:
 - Coulomb excitation on odd-mass radium and radon isotopes
 - Searches for permanent EDM in trapped radium isotopes

=> Looking for physics beyond the Standard Model

Applications

- Use known radiation from not totally exotic radioisotopes
- Profit from radionuclides:
 - Pure samples of radioisotopes (offline studies)
 - High detection efficiency for radiation (online studies)
- Techniques:
 - Emission Channeling
 - PAC (Perturbed Angular Correlations)
 - Diffusion
 - Photoluminescence

Biophysics and Parkinson disease

- Over 1/3 of all proteins require metal ions to function:

- Magnesium

Catalysis in cellular energy transformations

Photosynthesis - component of chlorophyll

- But they are difficult to study:

"Magnesium in biological chemistry is a Cinderella element: We know its hidden power and personality only indirectly since we are unable to label and follow it in a sensitive manner."

Metals in biology and beta-NMR

- New approach – beta-Nuclear Magnetic Resonance
 - Beta-decay of polarized nuclei is anisotropic
 - Resonances observed as change in decay asymmetry
 - ⇒ Up to 10^{10} more sensitive than conventional NMR

COLLAPS setup

- Proof-of-principle experiment
 - Magnesium-31 beam
 - Polarization with lasers
 - 1st beta-NMR in a liquid
- Outlook:
 - Funding from CERN Knowledge Transfer Fund
 - First biological studies on Mg and Cu

Studies of radioactive nuclides

Properties/observables (for ground states and isomers – long-lived excited states)

To obtain the full picture: need to study several properties and use several techniques

Charge radii of Be isotopes

- **Halo:** nucleus built from a core and at least one neutron/proton with spatial distribution much larger than that of the core
 - Interaction of the core and halo nucleons not well understood

A. Krieger et al,
Phys. Rev. Lett. 108 (2012) 142501

Combination of techniques: Charge radii of Hg & Au

176 178 180 182 184 186 188 190 192 194 196 198 200 202 204 206 208 210

RILIS, Windmill, ISOLTRAP teams

- Several techniques combined
- RILIS lasers to probe the hyperfine structure of Hg & Au isotopes
- Detection:
 - Alpha spectroscopy with Windmill
 - Selective ion counting in MR-ToF

EDM searches in radionuclides

odd-A Rn [TRIUMF]

odd-A Ra [Argonne]

odd-A Ra [Groningen]

odd-A Rn:

$^{219,221}\text{Rn}$ inferior to $^{223,225}\text{Ra}$

Next step: $^{223,225}\text{Rn}$
HIE-ISOLDE (CERN)

odd-A Ra:

Next step: ^{225}Ra directly
TSR@HIE-ISOLDE

Fundamental studies with traps

determine beta-neutrino ($\beta\nu$) correlation in β decay of ^{35}Ar with $(\Delta a/a)_{\text{stat}} \leq 0.5\%$
=>test the Standard Model

$$H_\beta = H_S + H_V + H_T + H_A + H_P$$

e.g: Fermi β decay ($0^+ \rightarrow 0^+$)

Angular distribution of β radiation

$$W(\theta) \approx 1 + a \frac{v}{c} \cos\theta$$

Current experimental limits:
(from nuclear & neutron β decay)
 $\frac{C_S}{C_V} < 7\%$, $\frac{C_T}{C_A} < 9\%^1$

$$a \approx 1 - \frac{|C_S|^2 + |C'_S|^2}{|C_V|^2}$$

Simulated ion recoil for different a

WITCH

Weak Interaction Trap for Charged particles

Transfer reactions on beryllium-11

- ^{11}Be :

- Halo nucleus
- Cluster structures in neighbours
- N=8 broken in ^{12}Be

dE vs Eback corrected for all fordet

CRIS

- Collinear Resonant Ionisation Spectroscopy
- High sensitivity, lower resolution -> perfect for heavy ions

5. Ions deflected on to decay spectroscopy station
6. Alpha-gamma coincidences used to identify the decay of $^{204g,m}\text{Fr}$ to ^{200}At

Open projects:

- IS471: Collinear resonant ionization laser spectroscopy of rare francium isotopes
IS531: Collinear resonant ionization spectroscopy for neutron rich copper isotopes

RILIS

- Resonant Ionization Laser Ion Source

COLLAPS – Ne charge radii

Laser spectroscopy

Intrinsic density distributions of dominant proton FMD configurations

HIE-ISOLDE

Quarter-wave resonators
(Nb sputtered)

- SC-linac between 1.2 and 10 MeV/u
- 32 SC QWR (20 @ $\beta_0=10.3\%$ and 12@ $\beta_0=6.3\%$)
- Energy fully variable; energy spread and bunch length are tunable. Average synchronous phase $fs= -20$ deg
- $2.5 < A/q < 4.5$ limited by the room temperature cavity
- 16.02 m length (without matching section)
- No ad-hoc longitudinal matching section (incorporated in the lattice)
- New beam transfer line to the experimental stations

WITCH

-> energy spectrum of recoiling ions with a retardation spectrometer
Use a Penning trap to create a small, cold ion bunch

First high-statistics run in Nov 2011: under analysis

- M. Beck et al., Eur. Phys. J. A47 (2011) 45
M. Tandecki et al., NIM A629 (2011) 396
S. Van Gorp et al., NIM A638 (2011) 192

Static Electric Dipole Moment implies CP-violation

Schiff Theorem: neutral atomic system of point particles in electric field readjusts itself to give zero E field at all charges.

BUT: finite size **and shape** of nucleus breaks the symmetry

V Spevak, N Auerbach, and VV Flambaum
PR C 56 (1997) 1357

related to Q_3

$$\text{Schiff moment: } S = -2 \frac{J}{J+1} \frac{\langle \hat{S}_z \rangle \langle \hat{V}_{PT} \rangle}{\Delta E}$$

energy splitting of parity doublet

Schiff moment enhanced by ~ 3 orders of magnitude in pear-shaped nuclei

EDM searches

ISOLDE

odd-A Rn [TRIUMF]

odd-A Ra [Argonne]

odd-A Ra [Groningen]

odd-A Rn:

$^{219,221}\text{Rn}$ inferior to $^{223,225}\text{Ra}$

| GdIG (solid) | Amherst | $^{213,225}\text{Ra}$ (trapped) | KVI |
| GGG (solid) | Yale/Indiana | ^{223}Rn (trapped) | TRIUMF |
| muon (ring) | J-PARC | deuteron (ring) | BNL? |

Matter-antimatter

- Sakharov conditions require CP symmetry violation
- This violation is observed in electro-weak interaction, but probably cannot account for matter-antimatter imbalance
- No evidence for CP violation in strong interaction
- $|d(n)| < 3.1 \times 10^{-26} \text{ e cm}$ (*Baker et al PRL 97 (2006) 131801*)
- $|d(^{199}\text{Hg})| < 3.1 \times 10^{-29} \text{ e cm}$ (*Griffith et al PRL 102 (2009) 101601*)
- $|d(\text{ThO})| < 8.7 \times 10^{-29} \text{ e cm}$ (*Baron et al arXiv:1310.7534v2 (2013)*)
- In many cases provides best test of extensions of the Standard Model that violate CP symmetry.
 - Accounted for by cancellations?
 - – study of minimal supersymmetric SM (J Ellis)
- CP violation in the lepton sector is not known, could also account for matter-antimatter difference

isotope

30Mg: E0 transition

E0 decay of 30Mg
electron spectrometer

Identification of 0^+ state at 1789 keV ; small mixing amplitude with spherical ground state
=> deformed state

30Mg: spherical 0^+ -ground-state,
deformed 1st 0^+ state (2 neutrons
across N=20) => **shape coexistence**

Laser spectroscopy and nuclear physics

- Spin (orbital+intrinsic angular momentum), parity (I^π)
- Nuclear ***g***-factor and magnetic dipole moment (g , and μ)
 - Electric quadrupole moment (Q)
 - Charge radius ($\langle r^2 \rangle$)

Give information on:

- Configuration of neutrons and protons in the nucleus
 - Size and form of the nucleus

Laser spectroscopy

Atomic hyperfine structure

(interaction of nuclear and atomic spins)

$$\Delta E_{HFS} = \frac{A}{2}K + B \frac{\frac{3}{4}K(K+1) - I(I+1)J(J+1)}{2(2I-1)(2J-1)I \cdot J}$$

where $K = F(F+1) - I(I+1) - J(J+1)$

$$A = \frac{\mu_I H_e(0)}{I \cdot J}$$

$$B = eQV_{zz}(0)$$

Isotope shifts in atomic transitions

(change in mass and size of different isotopes of the same chemical element)

$$\delta\nu^{A,A'} = (K_{NMS} + K_{SMS}) \times \frac{A'-A}{A'A} + F \times \delta\langle r^2 \rangle^{A,A'}$$

Nuclear Magnetic Resonance – NMR (Zeeman splitting of nuclear levels)

$$\Delta E_{mag} = |g_I| \cdot \mu_N \cdot B + \frac{1}{2} Q \cdot V_{zz}$$

Beta-detected NMR

Beta particles (e^-, e^+) can be used as a detection tool, instead of rf absorption
(beams down to 1000 ions/s can be studied)

Measured asymmetry:

$$A = \frac{N(0^\circ) - N(180^\circ)}{N(0^\circ) + N(180^\circ)}$$

Nuclear Magnetic Resonance – NMR
(Zeeman splitting of nuclear levels)

$$\Delta E_{mag} = |g_I| \cdot \mu_N \cdot B + \frac{1}{2} Q \cdot V_{zz}$$

Results:

Magnetic and electric moments of nuclei
(position of last nucleons, shapes)
